

CAPITA

Capita Application & Desktop Virtualisation Providing Flexible Workplace Services

IT Services

Today's increasingly-mobile workforce want seamless, reliable, anytime access to their applications and data on a growing set of devices such as laptops, mobile devices, and home PCs.

In addressing these user demands, IT must also maintain compliance and manage the corporate environment responsibly and efficiently.

Consumerisation of IT

With the explosive growth in consumer mobile devices showing no signs of slowing, organisations are increasingly being faced with how to allow access to corporate systems and data from consumer devices.

The iPad and iPhone, Android phones and tablets and other smart devices offer huge opportunities to boost business productivity but present management and operational risks that need to be understood and safely and securely addressed.

Thin client technologies can help organisations embrace these opportunities without risk to corporate or client data, allowing employees to enjoy more flexible access and businesses to capitalise on the consumerisation of IT.

Our Proposition

Capita's Application & Desktop Virtualisation solutions bridge these requirements by providing customers with a comprehensive suite of solutions to give their users the flexibility to work anywhere on a range of devices, while simplifying compliance and management through a centralised and unified infrastructure.

Benefits

Flexible, secure working – remote workers will enjoy the same secure access to applications as colleagues in the office.

Lower carbon footprint – when fully implemented, the virtualised desktop infrastructure is expected to reduce electricity demand and therefore contribute to customers' green initiatives and carbon reduction targets.

Simplified licensing costs – using enterprise agreements for volume licensing covers all the necessary software requirements to ensure network segregation.

Lower operating costs through centralisation – by managing networks, desktops, and servers centrally, your IT team's will reduce the need for IT specialists, therefore freeing your staff for higher value work.

Flexible application delivery – application virtualisation enables organisations to operate current and legacy applications across multiple platforms.

Enables dynamic business decisions – supporting tailored and flexible application services in ever changing business environments

Why Capita?

Knowledge – we understand the changing dynamics in the desktop market, and help our customers choose the right approach to meet their specific cost, management and flexibility needs.

Delivering the right solution – we ensure the best solutions are used to support each customer individually, with no use of a 'one size fits all' approach.

Experience – using our real world experience, we advise customers on the implications to security, storage, application deployment and operational management to ensure the benefits are maximised.

Best Practice – our resources and use of best practice, combined with our economies of scale, mean we can ensure the lowest price point and deliver the required Service Level Agreements.
